IUI (Intra uterine insemination)is a type of Infertility treatment where Ovulation Induction can be attempted with Sperm injected into the uterus. Q: What is IUI? A: Intrauterine insemination (IUI) is a procedure in which sperm are “washed” and placed into the uterus through a catheter. The male partner produces a semen sample by masturbation. The sperm are then separated from the seminal plasma, white blood cells, prostaglandins, and other “debris” which are filtered out during natural intercourse. A speculum is inserted into the woman’s vagina and a catheter with an attached syringe, containing the washed sperm, is inserted through the cervix into the uterus. The specimen (“prepared semen”) is injected and the catheter and the speculum are removed. Q: When and where are the sperm collected? A: Sperm can be collected either at home (specimen should arrive at CHR within an hour) or in our office. You can arrange in Hotel or guest house a stay for husbands/partners.(For out sider patients) Does sperm need to be prepared before IUI? Yes. Preparation takes approximately an hour. Insemination should occur shortly after the sperm has been prepared. Note= There is no any medical treatment available for TESTICULAR AZOOSPERMIA OVER [illegible]… TREATMENT OF OLIGO ASTHENO TERATO SPERMIA WITH [illegible] open stem cells INTRA [illegible] UTERUS [illegible] ALSO AVAILABLE DONOR SPERMS ON DEMAND. CHARGES FOR IUI & [illegible] KNOW MORE [illegible] Donors with [illegible] etc. available on demand [illegible] ONLY [illegible] TIME SAVING)
