MINI ITX gaming or general use computer (550 GBP)

Location   **Wales, Gwent**
https://www.freeadsz.co.uk/x-352381-z

New built gaming or general use PC. The PC has been built up over a few weeks and has only been used for short periods of time to run benchmarks and make sure everything works.

To note first the PC has a new install of windows 10 pro. This has been activated and is ready to go.

MOBO is a ASRock A68M-ITX FM2+

CPU is an AMD A4-6300. This is a duel core processor that i have clocking at 3.9GHz. Still runs at a 50 C + thermal margin at 100% load so a larger over clock could be achieved with ease.

GPU is a Zotac 560ti AMP! The card has been cleaned and had brand new Noctua thermal paste applied. The fan on the GPU ramps up quite a lot under heavy load but the PC is next to silent when idling or just browsing the net. This is quite an old card and the fan does ramp up quite a lot under 100% load.
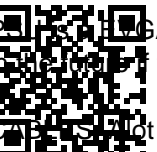

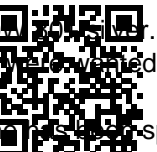

COOLING. Front intake consists of a 140mm fractal design fan and a 120mm cooler master SP fan for the radiator. Exhaust is provided by a 120mm fractal fan. The Loop has been custom done for the PC and not only keeps the PC cool but looks epic. I will include the left over bottle of mathems X1 fluid which would be more than enough to refill the loop. As well as this i will include the mayhems orange dye that has been used. Please note the fluid will need to be changed in about a year and half to two years to keep the cooling performance.

PSU is a EVGA 500w 80+ silver. This has more than enough power and would accommodate upgrades in the future if these were wanted.

CABLES. A lot of time has been spent to tidy up the cable work in this case. Looks fantastic in my view. The Orange cables are cable extensions and really make the PC.

Comes with a 1TB hard drive which will be more than enough for most.

CASE is an Fractal design nano s mini ITX. Really high quality and sturdy case. PLEASE NOTE THE FRONT USB 3.0 HEADERS DO NOT WORK ON THE CASE. However there are 6 usb ports on the back of the PC. This will be reflected in the price

RAM is 8gb of G.Skill ares DDR3-1333.

Currently it has a few pieces of software installed. These include the drivers that are needed for the hardware. As well as this i have installed Google chrome and steam. I have also installed AMD overdrive which allows you to do a small over clock (recommended not to adjust any of the setting unless you are 100% sure you know what you are doing). I have also installed heavy load to allow base benchmarking of the computer.

I have added two strips of white LEDS. These are used to light up the inside of the PC.

Mouse, keyboard and monitor are NOT included.

Please feel free to ask me any question on the item. I will be more than happy to help.
